Livecheck

FREE GUIDE · FOR LOVABLE, BOLT, V0 & CURSOR SITES

The Launch Checklist

Seven checks every AI-built site needs to pass before it goes live. Written for business owners, not developers. Tick them off one by one and you'll know exactly where your site stands.

01 Forms
02 Mobile
03 Domain (DNS)
04 Security (SSL)
05 SEO tags
06 Page speed
07 Browsers
+ Bonus: data safety

BEFORE YOU START

Your site is 80% done. This is the other 20%.

AI tools are brilliant at building something that looks finished. The problems show up when real visitors arrive: an enquiry form that sends nowhere, a layout that breaks on a phone, a "Not secure" warning, or a site Google never finds.

None of these need you to read code. Each check below tells you why it matters, how to test it yourself in a few minutes, and what usually causes the problem on AI-built sites.

1. Test the live site

Run every check on your real web address, not the preview inside your builder. Previews hide most of these problems.

2. Tick or flag

Tick each item that passes. If one fails, note what you saw. That note is gold for whoever fixes it.

3. Score yourself

Add up your results on the last page to see whether you're ready to launch.

01 · Forms

TIME: 10 MINUTES

Why it matters: your contact, booking and sign-up forms are how the site makes you money. A broken form fails silently: visitors think they've been in touch, and you never hear from them.

- [ ] Fill in every form on the site with real details and press send.
- [ ] The message actually arrives where it should: your inbox, your CRM or your database. Check your spam folder too.
- [ ] A clear "thank you" or confirmation appears after sending.
- [ ] Leave a required field blank, or type a bad email address. You see a helpful error, not a crash or a blank screen.
- [ ] Try it once on your phone as well as your computer.

COMMON CULPRITS

- The form was only connected inside the builder's preview.
- The email service's key wasn't added to the live site's settings.
- Database security rules quietly block new entries.

TIP

Ask a friend to send you an enquiry without telling you when. If you don't get it, neither will customers.

02 · Mobile

TIME: 10 MINUTES

Why it matters: most visitors to small business sites arrive on a phone. If the layout breaks, they leave before reading a word.

- [ ] Open the site on a real phone, not just a narrow browser window.
- [ ] Nothing spills off the side of the screen, and you never have to scroll sideways.
- [ ] Text is readable without pinching to zoom.
- [ ] Buttons and links are big enough to tap without hitting the wrong one.
- [ ] The menu opens, closes and every link in it works.
- [ ] Images resize properly and don't look stretched or cut off.

COMMON CULPRITS

- Sections set to a fixed width that only fits a laptop.
- Menus that only work with a mouse hover.
- Large tables or images with no room to shrink.

FREE TOOL

In Chrome, right-click › Inspect, then click the phone icon to preview common phone sizes. Still test on a real phone at the end.

03 · Domain (DNS)

TIME: 10 MINUTES

Why it matters: DNS is the address book that sends people from your web address to your site. Get it wrong and visitors see an error, an old site or a parked page.

- [ ] Both yourbusiness.co.uk and www.yourbusiness.co.uk load your new site.
- [ ] One version redirects to the other, so there's a single main address.
- [ ] The records at your domain company match exactly what your hosting company asked for.
- [ ] Old records from a previous site or "parked" page have been removed.
- [ ] The site loads on mobile data as well as your home Wi-Fi.

COMMON CULPRITS

- Leftover records pointing at an old host.
- The www version was never set up.
- Records changed in one place while the domain is managed somewhere else.

FREE TOOL

dnschecker.org shows where your address points around the world. Changes can take up to 48 hours to spread, so check again the next day.

04 · Security (SSL)

TIME: 5 MINUTES

Why it matters: without a working certificate, browsers show a "Not secure" warning. Most people leave immediately, and Google ranks you lower.

- [ ] The padlock shows in the address bar on every page, not just the home page.
- [ ] Typing http:// (without the "s") automatically takes you to https://.
- [ ] The padlock works on both the www and non-www versions of your address.
- [ ] No "partly secure" warnings, which usually mean an image or file is loading insecurely.
- [ ] Your host renews the certificate automatically, so it won't expire next year.

COMMON CULPRITS

- The certificate only covers one version of the address.
- DNS wasn't finished, so the certificate couldn't be issued.
- Images or scripts linked with http:// addresses.

FREE TOOL

ssllabs.com/ssltest gives your certificate a grade. Anything A or above is fine.

05 · SEO tags

TIME: 15 MINUTES

Why it matters: these hidden labels tell Google what each page is about. Many AI-built sites launch with none, or with settings that tell Google to stay away.

- [ ] Each page has its own title (what shows in the browser tab and in Google), roughly 50–60 characters.
- [ ] Each page has a short description, roughly 150–160 characters, written for a human.
- [ ] Right-click › View page source shows your actual words, not an almost empty page.
- [ ] yoursite/robots.txt does not say "Disallow: /", and pages aren't marked "noindex".
- [ ] yoursite/sitemap.xml exists and is submitted in Google Search Console.
- [ ] Sharing your link on WhatsApp or LinkedIn shows the right title and image.

COMMON CULPRITS

- Every page shares the same default title.
- The site builds its content in the browser, so Google sees a blank page.
- "Don't index" settings left over from the preview.

FREE TOOL

Google Search Console (search.google.com/search-console) shows whether Google can find and index each page.

06 · Page speed

TIME: 5 MINUTES

Why it matters: slow pages lose visitors and rank lower. Phones on mobile data feel every extra second.

- [ ] Run your home page through PageSpeed Insights and look at the **mobile** result.
- [ ] The main content appears in under 2.5 seconds (shown as "Largest Contentful Paint").
- [ ] Images are compressed and no bigger than they're shown on screen.
- [ ] The page doesn't jump around while loading.
- [ ] Repeat for your most important page after the home page, like pricing or booking.

COMMON CULPRITS

- Huge photos uploaded straight from a camera or AI image tool.
- Too many fonts, animations and tracking scripts.
- Everything loading at once instead of as you scroll.

FREE TOOL

pagespeed.web.dev, Google's own speed test, lists exactly what's slowing each page down.

07 · Browsers

TIME: 10 MINUTES

Why it matters: your site may look perfect in the browser you built it in and broken in the one your customer uses. Safari on iPhone is the usual troublemaker.

- [ ] The site looks and works right in Chrome, Safari, Firefox and Edge.
- [ ] Safari on an iPhone has been tested specifically.
- [ ] Forms, menus, pop-ups and booking widgets work in each one, not just the look.
- [ ] Fonts and icons load properly, with no empty boxes or default fonts.
- [ ] Nothing is hidden behind a cookie banner or chat widget.

COMMON CULPRITS

- Newer design features that Safari handles differently.
- Date pickers and form fields that behave differently per browser.
- Widgets that break on smaller iPhone screens.

TIP

No Mac or iPhone? Ask a friend or family member to click through the site on theirs and send you screenshots.

Bonus · Data safety

TIME: 5 MINUTES

Why it matters: if your site stores customer details or has logins, a small setup mistake can expose that data to anyone who knows where to look. AI tools don't always switch the protections on for you.

- [ ] If you use Supabase, every table holding customer data has "Row Level Security" turned on.
- [ ] Logged-out visitors can't see pages or data meant only for logged-in users.
- [ ] Secret keys (payment, email, database admin) are stored in your host's settings, never pasted into the site itself.
- [ ] Your site has a privacy policy if it collects names, emails or other personal details.

Your score

01 · Forms	Pass / Fail
02 · Mobile	Pass / Fail
03 · Domain (DNS)	Pass / Fail
04 · Security (SSL)	Pass / Fail
05 · SEO tags	Pass / Fail
06 · Page speed	Pass / Fail
07 · Browsers	Pass / Fail
Bonus · Data safety	Pass / Fail

All seven pass? You're ready to launch. **One or two fail?** Fix those before you send anyone to the site. **Three or more, or stuck on DNS and SSL?** That's the point where most owners lose a week. You don't have to.

STUCK ON ANY OF THESE?

We'll run all seven checks for you.

A Livecheck Site Check runs every test in this guide on your live site and sends you a plain-English report of what needs fixing. Want us to fix it too? Your £49 comes off Fix My Site or Go Live, and every fix comes with a money-back guarantee.

£49 · comes off any paid job you book afterwards
