Livecheck

LIVECHECK REPORT

reviewsproai.com

Seven checks plus data safety, run on the live site. Built with Next.js, hosted on Vercel.

Report **LC-0001**
Checked **3 Nov 2026**
Checked by **Chris Grigg**

Reviews Pro AI is built by Chris, who also runs Livecheck.

Verdict: ready for customers, with an SEO tidy-up to do. Six of the eight checks pass. Page speed is borderline on mobile, and the SEO set-up has four fixes that will help Google rank the site. None of these stop the site working today.

01 · Forms	Sign-up form and contact email tested end to end	Pass
02 · Mobile	No sideways scrolling, menu works, one small tap-size issue	Pass
03 · Domain (DNS)	Root, www and http all reach the same site	Pass
04 · Security (SSL)	A+ certificate grade, HTTPS forced	Pass
05 · SEO tags	Basics in place, four fixes needed	Needs work
06 · Page speed	Score 75 on mobile, main content at 5.2s	Borderline
07 · Browsers	Chrome, Safari (iPhone), Firefox and Edge	Pass
Bonus · Data safety	No secret keys exposed, database security on	Pass

01 · Forms

Pass

- Sign-up form: every field is labelled and required, browsers can autofill it, and Cloudflare Turnstile blocks spam bots.
- A test sign-up went through and the confirmation email arrived. A test email to hello@reviewsproai.com arrived too.
- Suggestion: the email field's example text is "tom@cruise.com". Use something like "you@yourbusiness.co.uk".
- Suggestion: the "email us" buttons open the visitor's mail app. On computers with no mail app set up, nothing happens. A simple contact form would catch those visitors.

02 · Mobile

Pass

- At phone width (375px) nothing spills off the screen, and the page never scrolls sideways.
- The menu opens, closes, and its links jump to the right section.
- Pricing cards, FAQ and footer all stack cleanly.
- Small fix: footer links are only 20px tall. Aim for about 44px so they're easy to tap.

03 · Domain (DNS)

Pass

- reviewsproai.com, www.reviewsproai.com and the http:// versions all land on `https://www.reviewsproai.com`.
- DNS at Porkbun points correctly to Vercel. No leftover records from an old host.

04 · Security (SSL)

Pass

- SSL Labs grade: **A+**.
- HTTPS is forced for two years (HSTS), and nothing on the page loads insecurely.

05 · SEO tags

Needs work

- Real content is in the page source, so Google can read it. robots.txt allows everything, there's a share image, and each page has one main heading.
- **Home page title is just "Reviews Pro AI"** (14 characters, no search words). Try "Get More Google Reviews Automatically | Reviews Pro AI".
- **Same description on every page** except the blog posts: home, sign-up, sign-in, terms, privacy and legal all share one.
- **Sitemap lists the wrong pages.** It includes `/apple-icon.png`, `/forgot-password` and `/reset-password`, and leaves out all six blog posts.
- **Broken canonical on sign-in.** `/signin` tells Google its real address is `/auth/signin`, which returns a 404.
- Also: the home page has no canonical tag of its own.

06 · Page speed

Borderline

75	5.2s	3.0s	0
Performance (mobile)	Main content shown (target 2.5s)	First content shown	Layout shift (excellent)

- **Pages are never cached.** The home page is sent with `Cache-Control: no-store`, so every visit reloads it in full and the browser's instant back button is switched off. The home page can be served as a static page.
- Two stylesheets hold up the first paint (about 150ms).
- Accessibility scored 96. Faint text (small grey labels, green text, pricing lists) fails the contrast check. Slightly darker shades get it to 100.
- Best practices 100, blocking time 20ms.

Lab test from Chrome Lighthouse with mobile throttling. Browser extensions were active during the run and add their own code, so real visitors will likely see a faster page.

07 · Browsers

Pass

- Checked in Chrome, Safari on iPhone, Firefox and Edge. Layout, menus and forms work in all four.
- No errors in the browser console.

Bonus · Data safety

Pass

- The only key in the front-end code is Supabase's public key, which is designed to be public. No payment, email or admin keys are exposed.
- Customer tables return no data to logged-out visitors, and Row Level Security is confirmed on in Supabase.
- Privacy policy, terms and company details are published.
- Worth checking: no DKIM email signing record was found at the usual names, and DMARC is set to `p=none`. Since review requests go out by email, confirm the sending service signs them so they don't land in spam.

Fix list, in order

Estimated 2–3 hours

1. **Serve the home page as a static page** so it's cached. Biggest speed win.
2. **Rewrite the home page title** and give each page its own description.
3. **Clean up the sitemap**: remove the icon and password pages, add the blog posts.
4. **Fix the sign-in canonical** so it points to `/signin`.
5. **Darken the faint text** to pass contrast checks.
6. **Make footer links taller** for easier tapping on phones.
7. **Confirm email signing** (DKIM) with your email sender.
